Closed Loop Stepping System

## 1 Network Based Motion Control

A maximum of 16 axis can be operated from a PC through RS-485 communications. All of the Motion conditions are set through the network and saved in Flash ROM as a parameter.

Motion Library(DLL) is provided for programming under Windows XP/7/8/10.

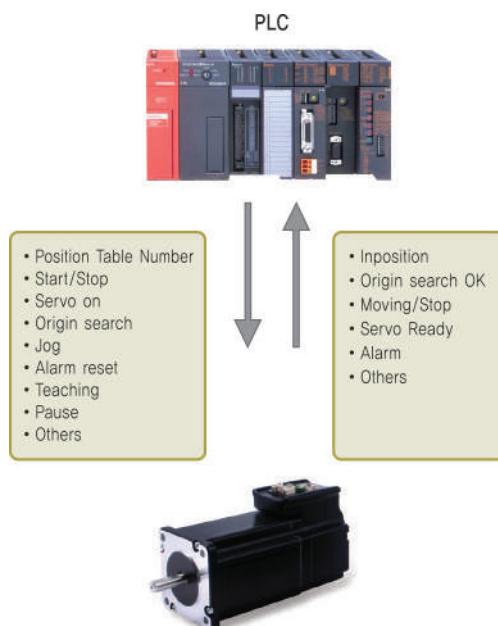

## 2

## Position Table Function

Position Table can be used for motion control by digital input and output signals of host controller.

You can operate the motor directly by sending the position table number, start/stop, origin search and other digital input values from a PLC.

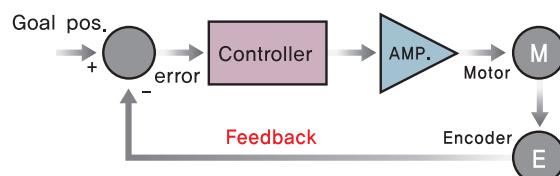

The PLC can monitor the In-Position, origin search, moving/stop, Servo ready and other digital output signals from a drive. A maximum of 64 positioning points can be set from PLC.

## 3

## Closed Loop System

Ezi-SERVO is an innovative closed loop stepping system that utilizes a high-resolution motor mounted encoder constantly to monitor the current position. The encoder feedback allows the Ezi-SERVO to update the current position every 25 micro seconds. It allows the Ezi-SERVO drive to compensate for the loss of position, ensuring accurate positioning. For example, due to a sudden load change, a conventional stepper motor and drive could lose a step but Ezi-SERVO automatically correct the position by encoder feedback.

## 4 Absolute Encoder System

High resolution of absolute position encoder is equipped (single turn: 262,144/rev, multi turn: 4,096/rev) In addition, even power supply of driver shuts off, it enables to know the previous location and the secondary power supply for the encoder (ie : battery) is not required.

※ Only for Ezi-SERVO-ALL-60-ABS series

## 5 IP65 Protection

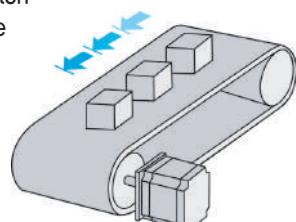

By acquiring IP65 rating, it can be used in harsh environments like water splashes or lots of dusts.

※ Only for Ezi-SERVO-ALL-60/60-ABS series

## 6 No Gain Tuning

To ensure machine performance, smoothness, positional error and low servo noise, conventional servo systems require the adjustment of its servo's gains as an initial crucial step. Even systems that employ auto-tuning require manual tuning after the system is installed, especially if more than one axis are interdependent. Ezi-SERVO employs the best characteristics of stepper, closed loop motion controls and algorithms to eliminate the need of tedious gain tuning required for conventional closed loop servo systems. This means that Ezi-SERVO is optimized for the application and ready to work right out of the box. The Ezi-SERVO system employs the unique characteristics of the closed loop stepping motor control, eliminating these cumbersome steps and giving the engineer a high performance servo system without wasting setup time. Ezi-SERVO is especially well suited for low stiffness loads (for example, a belt and pulley system) that sometime require conventional servo systems to inertia match with the additional expensive and bulky gearbox.

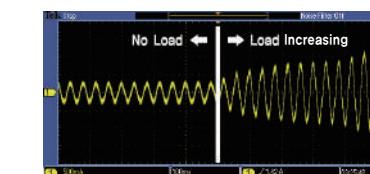

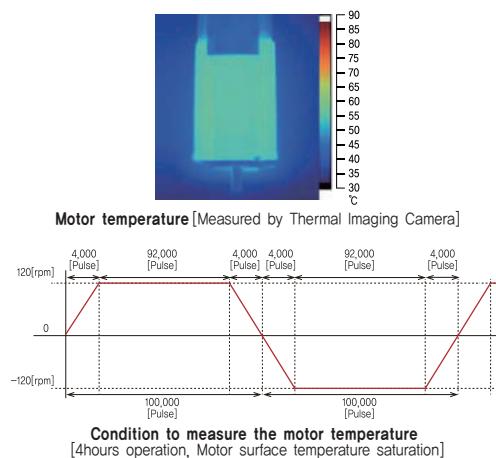

Ezi-SERVO also performs exceptionally, even under heavy loads and high speeds.

## 7 Heat Reduction / Energy Saving

(Motor Current Control according to load)

Ezi-SERVO automatically controls motor current according to load. Ezi-SERVO reduces motor current when motor load is low, and increases motor current when load is high. By optimizing the motor current, motor heat can be minimized and energy saved.

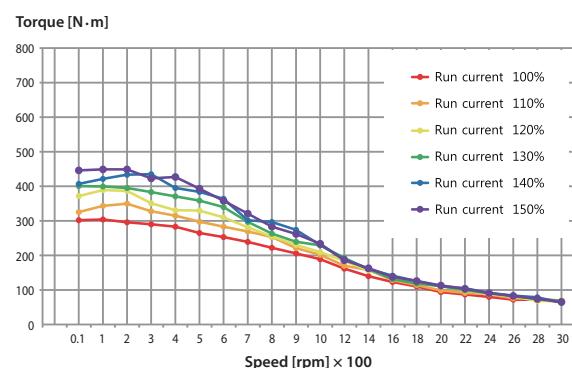

Example of the Motor Current Control according to load

## 8 Torque Improvement

(Motor Current Setting)

Ezi-SERVO can increase the motor current up to 150% by setting the Run Current by parameter. Therefore, acceleration and deceleration characteristics and torque characteristics at low speed can be increased.

Ezi-SERVO can improve the torque in the low speed range by about 30%.

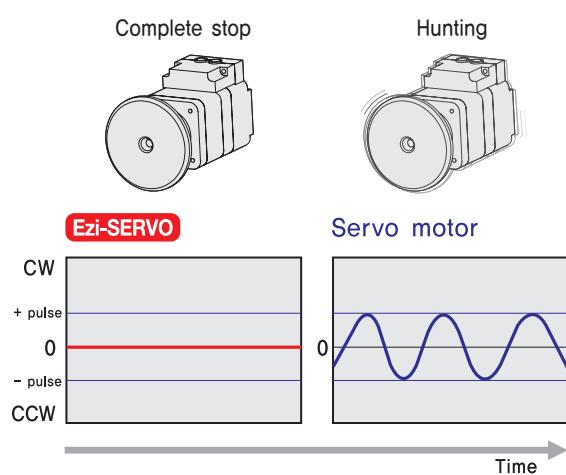

\* The torque at low speed is improved about 30%.

Measured Condition : Drive = Ezi-SERVO-ALL-42L  
Motor Voltage = 24VDC  
Input Voltage = 24VDC

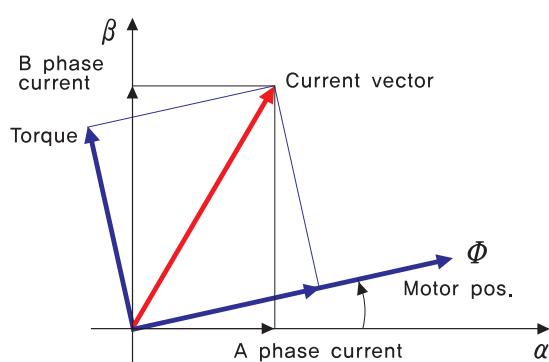

## 9 No Hunting

Traditional servo motor drives overshoot their position and try to correct overshooting by moving the opposite direction, especially in high gain applications. This is called null hunt and is especially prevalent in systems that the break away or static friction is significantly higher than the running friction. The cure is lowering the gain, which affects accuracy or using Ezi-SERVO Motion Control System. Ezi-SERVO utilizes the unique characteristics of stepping motors and locks itself into the desired target position, eliminating Null Hunt. This feature is especially useful in applications such as nanotech manufacturing, semiconductor fabrication, vision systems and ink jet printing in which system oscillation and vibration could be a problem.

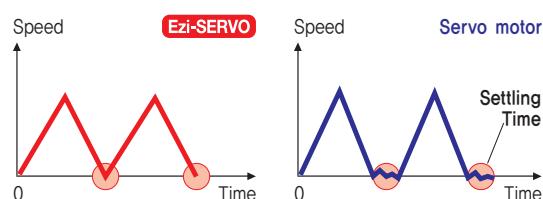

## 10 Smooth and Accurate

Ezi-SERVO is a high-precision servo drive, using a high-resolution encoder with 20,000 pulses/revolution. Unlike a conventional Microstep drive, the on-board high performance DSP (Digital Signal Processor) performs vector control and filtering, producing a smooth rotational control with minimum ripples.

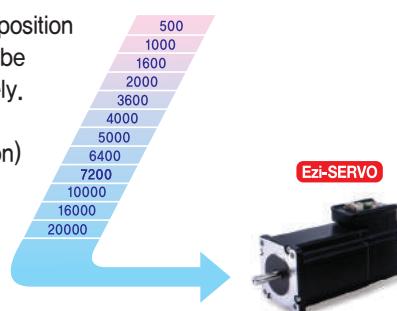

## 11 Fast Response

Similar to conventional stepping motors, Ezi-SERVO instantly synchronizes with command pulses providing fast positional response. Ezi-SERVO is the optimum choice when zero-speed stability and rapid motions within a short distance are required. Traditional servo motor systems have a natural delay called settling time between the command input signals and the resultant motion because of the constant monitoring of the current position.

## 12 High Resolution

The unit of the position command can be divided precisely. (Max. 20,000 pulses/revolution)

## 13 High Torque

Compared with common step motors and drives, Ezi-SERVO motion control systems can maintain a high torque state over relatively long period of time. This means that Ezi-SERVO continuously operates without loss of position under 100% of the load. Unlike conventional Microstep drives, Ezi-SERVO exploits continuous high torque operation during high speed motion due to its innovative optimum current phase control.

## 14 High Speed

The Ezi-SERVO operates well at high speed without the loss of synchronism or positioning error. Ezi-SERVO's ability of continuous current position monitoring enables the stepping motor to generate high torque, even under a 100% load condition.

## ● Advantages over Open-Loop Control Stepping Drive

1. Reliable positioning without loss of synchronism.
2. Holding stable position and automatically recovering to the original position even after experiencing positioning error due to external forces, such as mechanical vibration or vertical positional holding.
3. Ezi-SERVO utilizes 100% of the full range of rated motor torque, contrary to a conventional open-loop stepping driver that can use up to 50% of the rated motor torque due to the loss of synchronism.
4. Capability to operate at high speed due to load-dependant current control, open-loop stepping drivers use a constant current control at all speed ranges without considering load variations.

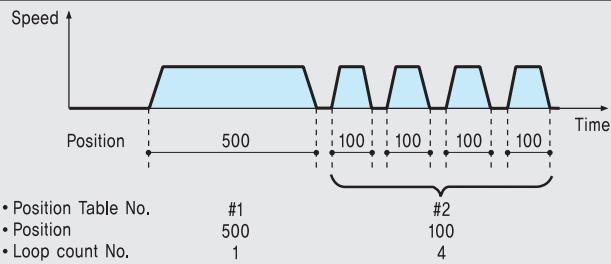

## ● Advantages over Servo Motor Controller

1. No gain tuning. (Automatic gain adjustment in response to a load change)
2. Maintains the stable holding position without oscillation after completion of positioning.
3. Fast positioning due to the independent control by on-board DSP.
4. Continuous operation during rapid short-stroke movement due to instantaneous positioning.

## ● Features of Motion Controller

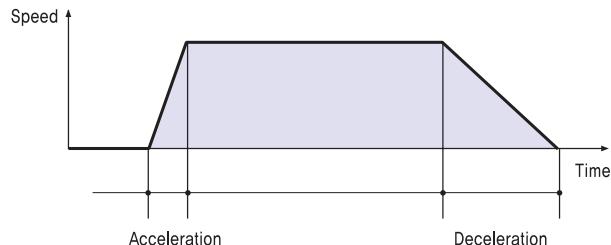

### 1. Loop Count

This function allows positioning repeatedly according to the Loop Count Number.

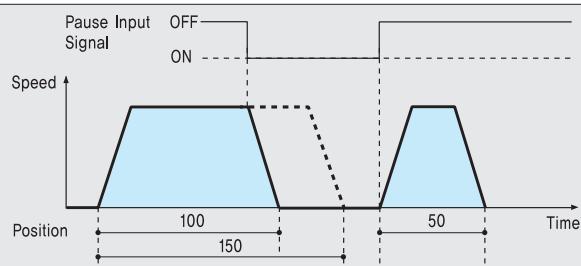

### 2. Acceleration/Deceleration

For quick acceleration and gradual deceleration, you can set each acceleration and deceleration time separately.

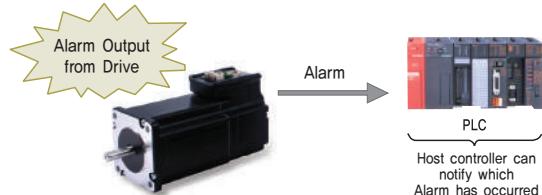

### 3. Pause

You can pause the motion upon the input of an external signal. When Pause signal change to OFF, the motor will restart to original target position.

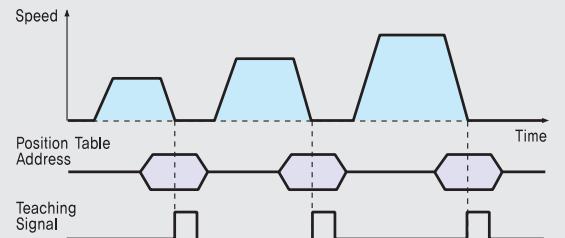

### 4. Alarm

The number of 7-Segment flashing time indicates which Alarm has occurred.

### 5. Teaching

Teaching signal is used to memorize current Position data into the selected Position Table item.

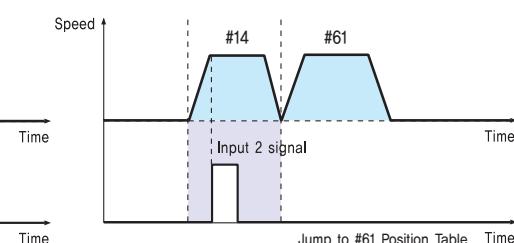

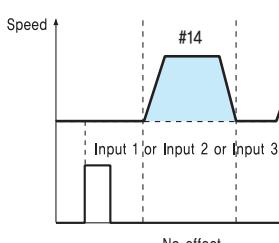

### 6. Jump

Within one Position Table, you can select various Position Table numbers that you want to jump. With three external input signal during movement, the next jump Position Table number can be select,

Ezi-SERVO-ALL-56/60/60-ABS series control Brake by Drive automatically.  
 Please refer to below Timing Chart when control Brake from upper controller other than using  
 Ezi-SERVO-ALL-56/60/60-ABS series Brake control.  
 Otherwise, Drive malfunctioning and loads can be fall down.  
 Also, please do not operate Brake while motor operation to prevent damage.  
 Ezi-SERVO-ALL-28 series has no brake control function.

## ● Settings and Operation [Ezi-SERVO-ALL-28 series]

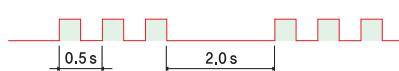

### 1. Status LED

In the case of Ezi-SERVO-ALL-28 series products, LED can be checked by LED color, lighting, On/Off and blinking.

Status	LED	Description
Disable	Green :  Red :	Green light flashing, Red light off
Enable	Green :  Red :	Green light on, Red light off
Enable & Communication	Green :  Red :	Green light on, Right flashing
In motion	Green :  Red :	Green light on, Red light on
In-position deviation	Green :  Red :	Green and Red light alternately flashing
Alarm	Green :  Red :	Red light flashing repeatedly as many as alarm number

### ◆ Protection functions and LED flash times

Times	Protection	Conditions
1	Over Current Error	The current through power devices in inverter exceeds the 4.8A
2	Over Speed Error	Motor speed exceeds 3,000 [rpm]
3	Position Tracking Error	Position error value is higher than 90° in motor run status *1
4	Over Load Error	The motor is continuously operated more than 5 seconds under a load exceeding the max. torque
5	Over Temperature Error	Inside temperature of drive is abnormally high
6	Over Regeneratived Voltage Error	Back-EMF is higher than 48V
7	Motor Connect Error	The power is ON without connection of the motor cable to drive
8	Encoder Connect Error	Cable connection error with Encoder connection in drive
10	In-Position Error	After operation is finished, a position error occurs
12	ROM Error	Error occurs during tuning execution
15	Position Overflow Error	Position error value is higher than 90° in motor stop state *1

Alarm LED flash  
(Ex, Position tracking error)

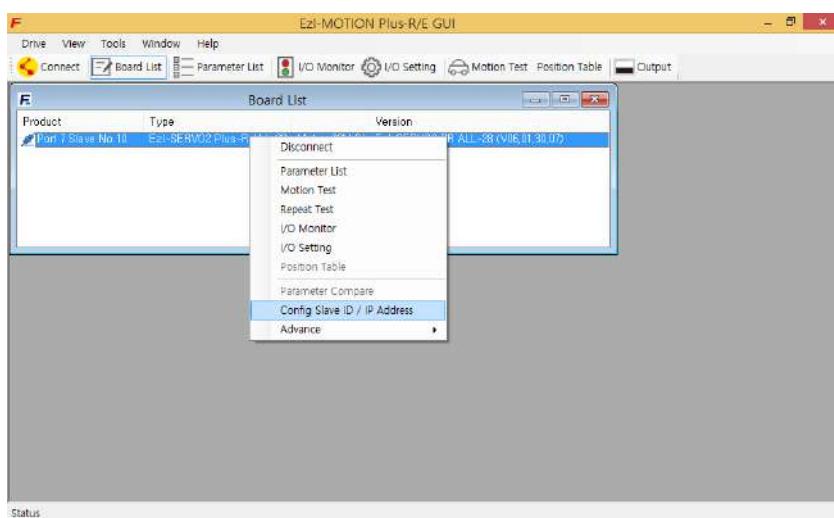

\*1 : Default value can be changed by parameter(Refer of the Manual)

## 2. Termination Setting

When pin 9 and pin 10 of the connector(CN1) are connected externally, the drive is set to the end of the network. If the drive is connected to the end of the communication network, set it to the termination.

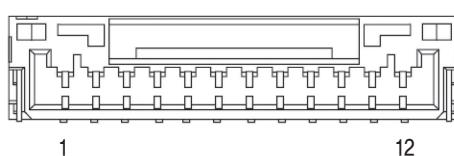

## 3. Network ID Setting

The network ID of Ezi-SERVO-ALL-28 series can be set using Ezi-MOTION Plus-R GUI (Version 6.40.7.12 or later). After connecting the communication, the setting window appears by selecting the product and press the right button of the mouse.

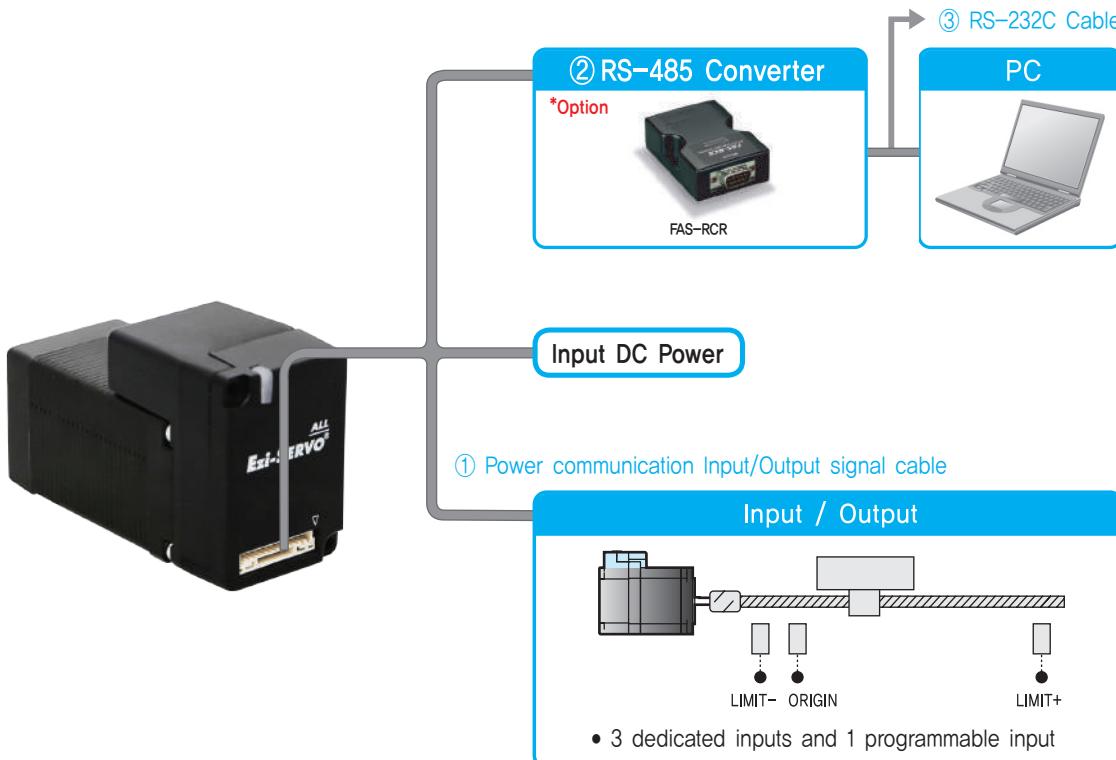

## 4. Power Communication Input/Output Signal Connector(CN1)

### 1. Options

#### ① Power Communication Input/Output

##### Signal Cable

Available to connect between Control System and Ezi-SERVO-ALL-28.  
(It is provided item as standard option)

Item	Length [m]	Remark
CSVA-A-OR4F	0.4	Normal Cable

※ This cable is provide item as standard option.

#### ② FAS-RCR(RS-232C to RS-485 Converter)

Item	Specification
Comm. Speed	Max. 115.2 [kbps]
Comm. Distance	RS-232C: Max. 15m RS-485: Max. 1,2km
Connection Type	RS-232C: DB9 Female RS-485: RJ-45
Dimension	50×75×23mm
Weight	38g
Power	Powered from PC (Usable for external DC5~24V)

#### ③ RS-232C Cable

Available to connect between RS-232C port of master and FAS-RCR.

Item	Length [m]	Remark
CGNR-C-002F	2

## ● Settings and Operation [Ezi-SERVO-ALL-42/56 series]

### ◆ Protection functions and 7-Segment flash times

When Alarm occurs, can recognize main reason of alarming thru by 7-Segment flash times which indicates Network ID.

Times	Protection	Conditions
1	Over Current Error	The current through power devices in inverter exceeds the 4.8A
2	Over Speed Error	Motor speed exceed 3,000rpm
3	Position Tracking Error	Position error value is higher than 90° in motor run state *1
4	Over Load Error	The motor is continuously operated more than 5 seconds under a load exceeding the max. torque
5	Over Temperature Error	Inside temperature of drive exceeds 85°C
6	Over Regeneratived Voltage Error	Back-EMF is more than 48V value
7	Motor Connect Error	The power is ON without connection of the motor cable to drive
8	Encoder Connect Error	Cable connection error with Encoder connection in drive
10	In-Position Error	After operation is finished, a position error occurs
12	ROM Error	Error occurs during tuning execution
15	Position Overflow Error	Position error value is higher than 90° in motor stop state *1

\*1 : Default value can be changed by parameter(Refer of the Manual)

### 1. Termination Setting Switch(SW1)

The drive installed at the end of the network must be terminated for reliable operation. Please termination setting switch is ON if drive installed at the end of the network.

### 2. Network ID Setting Switch(SW2)
